Assignment 1

Mac C++ Hello World Tutorial

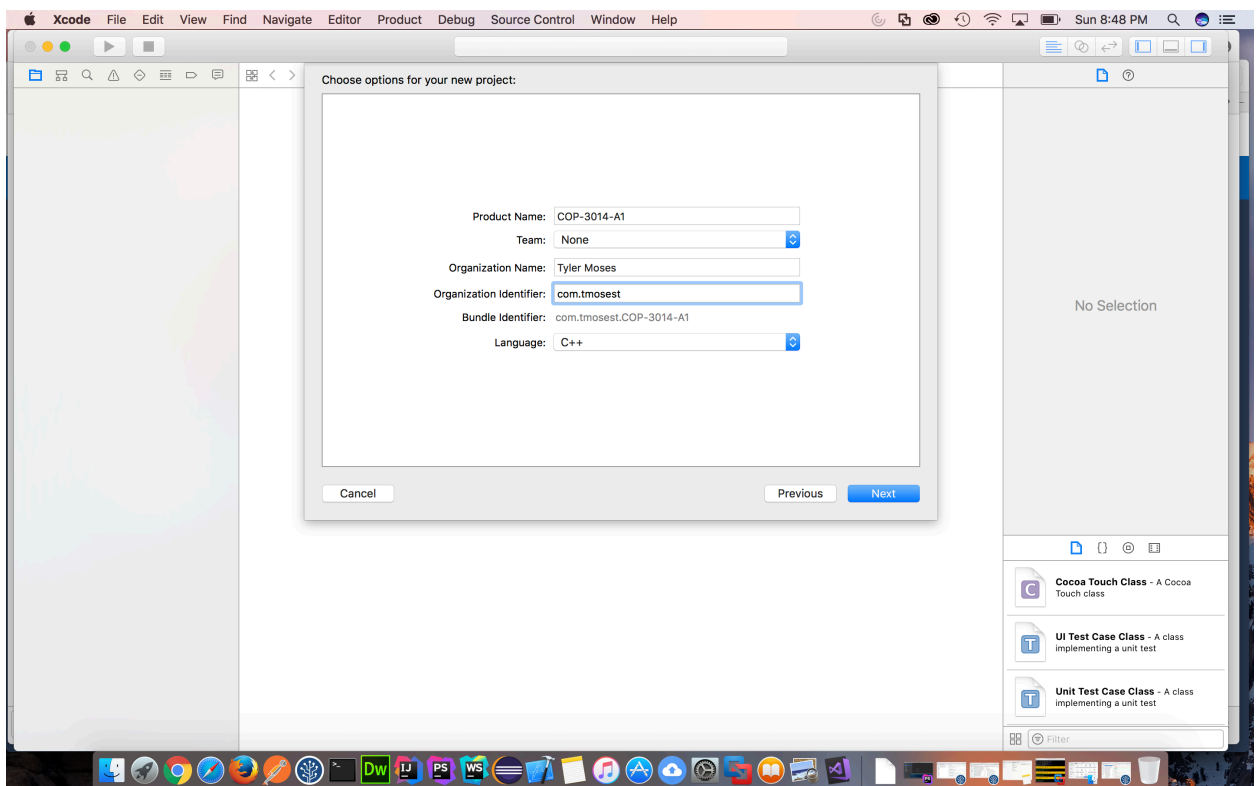

While it is recommended to download Visual Studio Community, I used Xcode. Here is what the VS download page looks like.

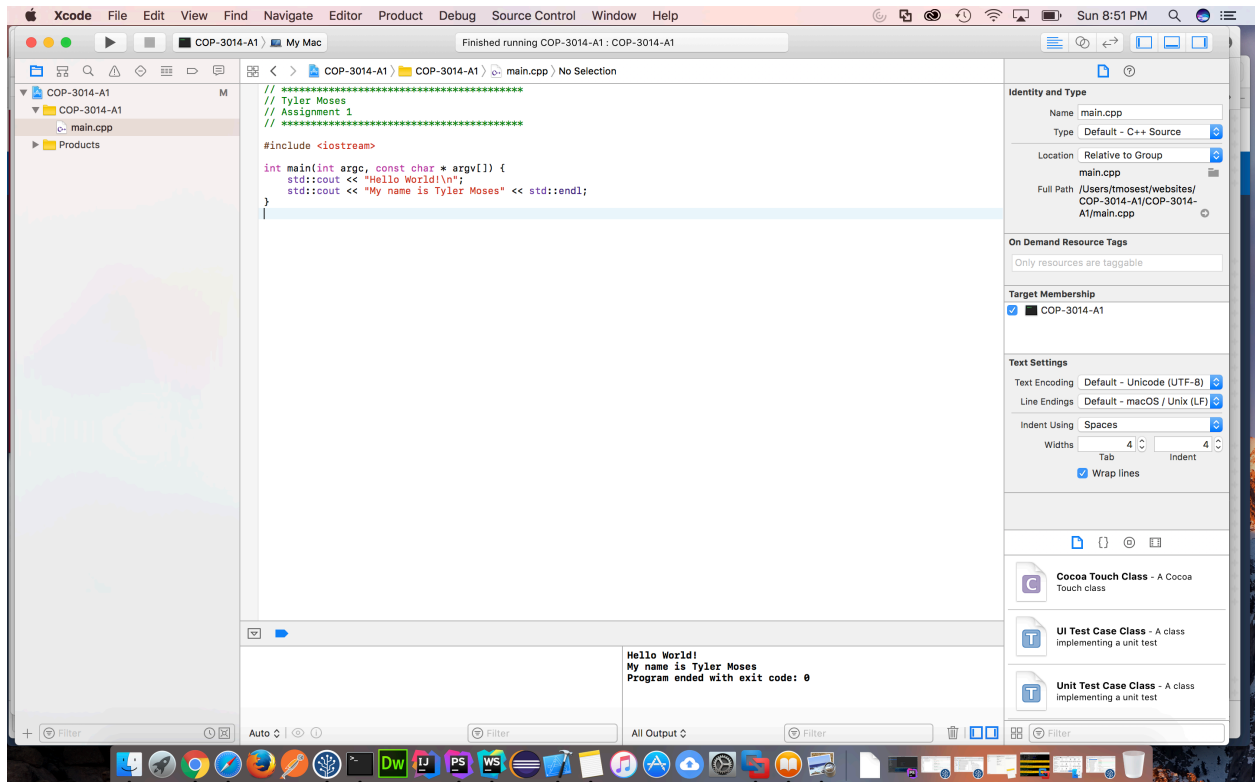

Now if you have OS X then go ahead and open Xcode or install it first using the App Store. After that open Xcode and click new project. From there navigate to the “MacOS” section and select “Command Line Interface”.

After that we will be presented with a form for Project Details. The important part is to switch to C++ and name it something that makes sense like COP-3014-A1.

From there I opened up main.cpp which was auto generated and updated it to contain the code from the assignment.

I tested the code by clicking on the play button and you can see that in the bottom panel it has outputted the custom message that I typed in. From there I just copied the file and renamed it and zipped it up with the pdf tutorial.
